YardMatch

Investing in recurring local property care

A managed marketplace for homeowners and local service businesses

Investor discussion draft
September 2026

The investment thesis

Own a share of the company that helps local service relationships form and continue.

A useful first transaction

A qualified recommendation helps a homeowner book and gives a provider a new customer.

An ongoing reason to return

Schedules, service history, arrival updates and issue resolution keep later visits connected.

The opportunity depends on profitable repeat use

Local density can lower acquisition and operating costs. Each expansion must demonstrate those savings before it earns more capital.

Investment hypothesis. The model does not assume subscriptions, advertising or repeated finder fees from the same relationship.

Booking is only the start of the work

YardMatch connects the customer request to the provider's schedule and the crew's actual visit.

Customer need	Provider need	YardMatch response
A suitable, available business	New work that fits the route	One recommendation and a few qualified backups
Confidence about arrival	A schedule crews can execute	Shared job details and arrival updates
A dependable next visit	Repeat business without another finder fee	Rebooking, service records and follow-up

Local referrals can supply trust. Direct texting and field-service tools can coordinate work. YardMatch aims to connect discovery with the ongoing job.

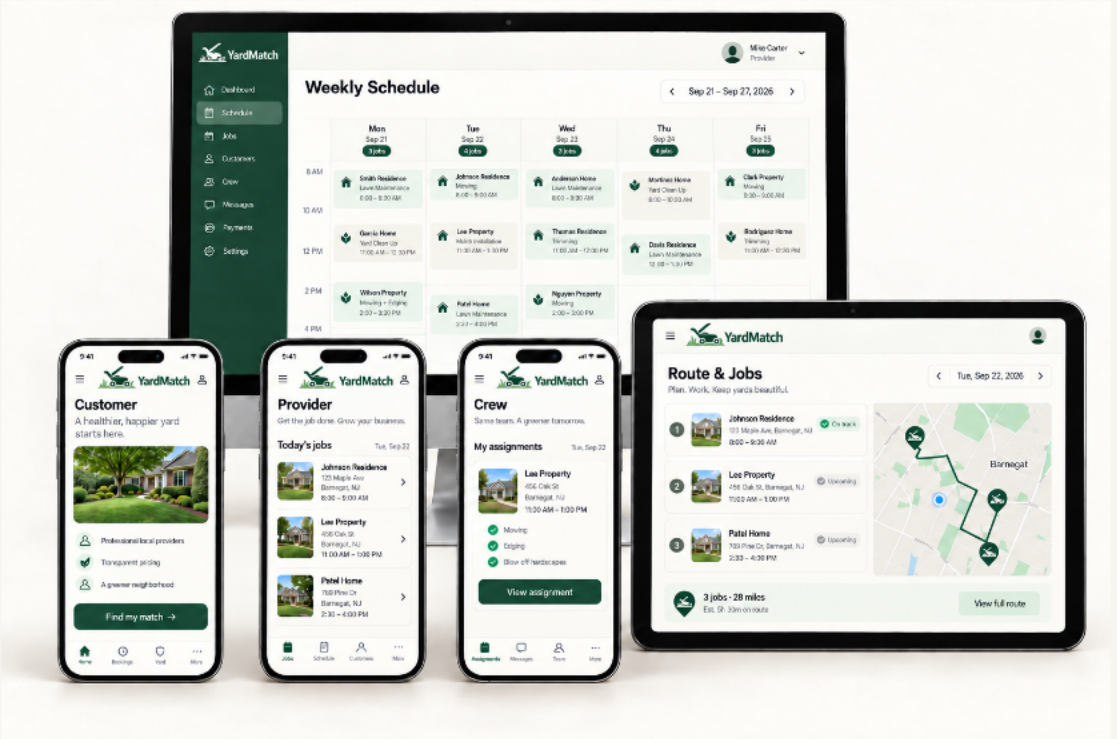

One service experience across three roles

Customer, provider and crew share the job while each sees the information needed for their role.

Customer
Book and follow the visit

Provider
Schedule and assign work

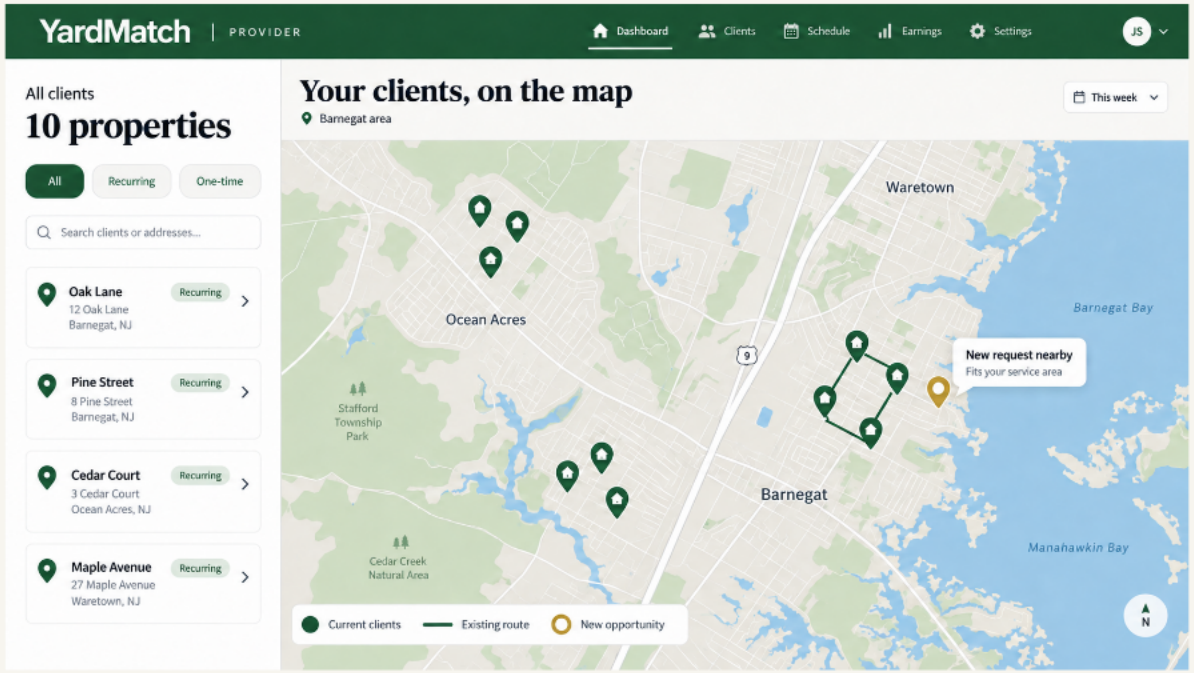

Crew
Know the place and task

Illustrative screens and sample data from the partner pitch. They do not show live customers or app-store availability.

Local density benefits both sides

Nearby bookings can fit existing routes and make a provider's customer base more valuable.

Provider control

The business chooses its service area, capacity and crew assignments.

Customer trust

Recommendations favor service fit and reliability. Paid placement does not set the order.

Route savings and retention effects remain to be measured. Providers handle equipment, insurance, supervision and crew pay.

A finder fee plus $2.99 for every paid service

Providers pay both fees. YardMatch covers modeled processing costs.

$45

Once per new customer/provider pairing, after the first paid completed job

$2.99

On every paid completed service, including repeat visits

A $60 service	First paid visit	Later paid visit
Provider proceeds before business costs	**$12.01**	**$57.01**

Welcome offer waives the first $45 finder fee for a new provider. It does not waive the $2.99 service fee. No customer surcharge modeled.

Zocdoc monetizes a different relationship pattern

A new service category does not automatically create a new YardMatch finder fee.

	Zocdoc	YardMatch
Fee event	New patient/provider discovery booking	First paid job in a new customer/provider pair
Return to the same provider	No new discovery fee	No new finder fee. $2.99 service fee applies.
New category	May introduce a different doctor	May use the same landscaping company
Core revenue opportunity	More qualifying new provider connections	More profitable paid visits over time

Zocdoc also exempts reputation and certain partner bookings. Fewer providers per YardMatch household is a hypothesis. Cross-category finder-fee revenue is zero in this forecast.

At $60, repeat card payments leave about $0.20

Illustrative contribution after payment costs and variable operating costs, before acquisition and fixed overhead.

Per paid repeat service	Card	Bank debit (ACH)
Provider service fee	$2.99	$2.99
Payment processing	($2.04)	($0.48)
Payouts, account costs and variable operations	($0.75)	($0.75)
Contribution before fixed overhead	**$0.20**	**$1.76**

About $66

Card-ticket ceiling for a positive repeat contribution under these assumptions.

Larger jobs need separate pricing economics

A $100 card-paid repeat job loses about $1.14 before fixed costs. ACH excludes a $1.50 initial bank-link allowance. Rates and operating costs are assumptions or published standard prices.

Barnegat is a starting market

The investment case requires expansion into many local markets after the first market works.

10,265

Barnegat households

88%

Homes occupied by their owners

500 paying households in the first forecast year

About 5.5% of the roughly 9,033 owner households. Actual eligible lawns and willingness to pay remain unmeasured.

Census 2020-2024 estimates. Launch target is illustrative. Later-year household totals require regional and multi-market expansion.

Expansion follows verified local economics

A proposed sequence for acquiring supply and demand without sacrificing service reliability.

1. Concentrated provider launch

Recruit qualified businesses around neighboring routes. Use the first-client finder-fee waiver.

2. Measured household acquisition

Test local search, neighborhood referrals and provider referrals. Count paying customers, not leads.

3. A complete service season

Measure paid repeat visits, fee acceptance, service quality and cost per completed job.

4. A second local market

Expand only after retention and acquisition economics repeat across providers and neighborhoods.

Product progress and commercial evidence

An early company with working product workflows and commercial assumptions still to validate.

Product foundation

Customer booking and rebooking, provider calendars and client maps, crew assignments, payments and ops workflows.

Launch work remaining

Live payment acceptance, provider onboarding, production readiness and store distribution need independent verification.

Founder and operating team

Patrick leads the company. The model budgets paid staff, including founder compensation. Other owner roles remain to be defined.

Commercial evidence required

No verified revenue, paying customer base, signed provider count or measured retention is claimed in this deck.

What can increase the value of the company

More paying households matter when the relationships remain profitable and stay on the platform.

Value driver	Evidence an investor can evaluate
Household retention	The next season’s paid bookings, not just app activity
Provider density	More completed jobs per service area and less unfilled demand
Acquisition efficiency	Contribution earned relative to cost per first paying household
Operational reliability	On-time visits, fewer service issues and resolved payment failures

The model assigns no revenue to subscriptions, provider recruiting fees, advertising or specialist cross-sell. These remain optional future tests.

The forecast makes the assumptions visible

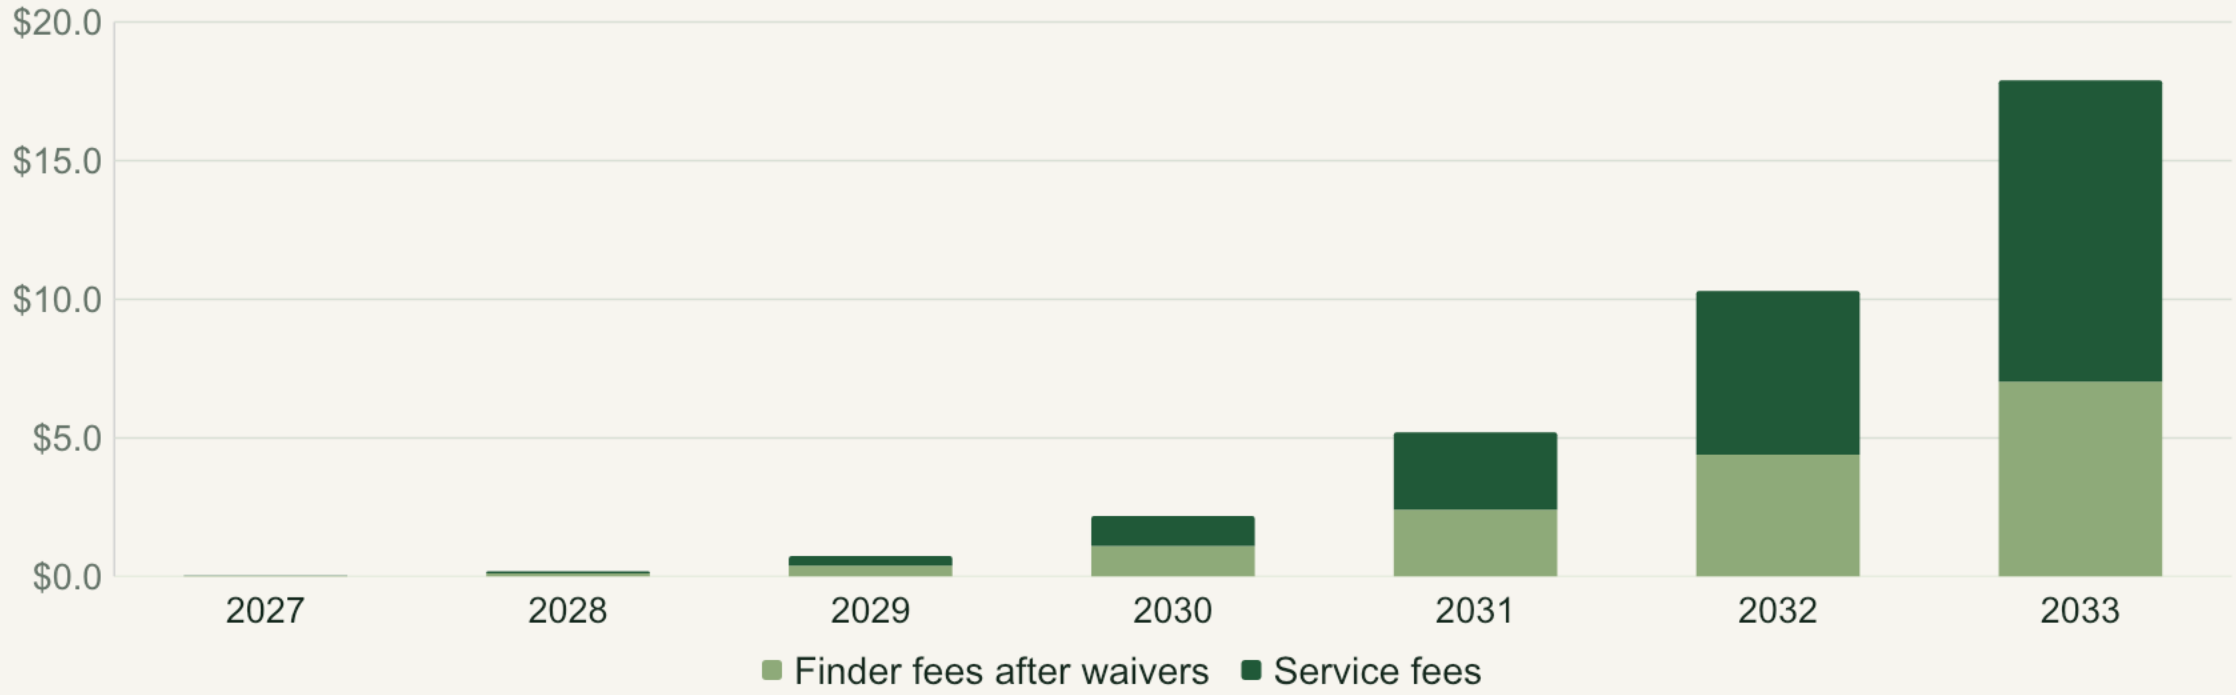

2027-2033 calendar years. No historical operating results are implied.

Driver	Downside	Base	Upside
New paying households, 2027 / 2033	300 / 40,000	500 / 160,000	500 / 280,000
Annual retention by 2033	65%	80%	85%
Scheduled visits per full season	16	20	24
Visits kept on platform	80%	90%	95%
ACH share, 2027 / 2033	0% / 20%	10% / 60%	20% / 75%
Cash CAC, 2027 / 2033	$75 / $50	$55 / $28	$45 / $22

Base: $60 service ticket, 95% completion/collection, eight payout-active months, 3 to 36 paid employees. All cases retain $45 plus $2.99 pricing.

Base revenue reaches $17.9m in 2033

Net marketplace revenue, US$ millions. Finder fees and recurring fees are distinct revenue streams.

Base 2033: 292,448 year-end paying households, 3.63m paid visits and $218.0m GMV. The $218.0m is service volume, not YardMatch revenue.

Base operating profitability arrives in 2033

US$ millions. The company funds several loss-making years before reaching this scale.

Base forecast	2027	2028	2029	2030	2031	2032	2033
Revenue	$0.03	$0.19	$0.73	$2.18	$5.20	$10.30	$17.89
Gross profit	$0.02	$0.12	$0.47	$1.38	$3.29	$6.41	$11.02
EBITDA	**($0.37)**	**($0.63)**	**($0.99)**	**($1.29)**	**($1.30)**	**($0.62)**	**$0.78**
Operating profit	($0.37)	($0.64)	($1.02)	($1.33)	($1.36)	($0.72)	$0.64
Net income proxy	**($0.37)**	**($0.64)**	**($1.02)**	**($1.33)**	**($1.36)**	**($0.72)**	**$0.48**
Free cash flow	($0.38)	($0.67)	($1.09)	($1.50)	($1.73)	($1.38)	($0.56)

2033 net income is $0.48m, while free cash flow is ($0.56m) because growth requires more risk cash and equipment. Profit and cash generation differ.

Returns depend on execution, not volume alone

All three cases use the same provider pricing. Retention, acquisition and payment mix change the outcome.

Result	Downside	Base	Upside
2031 revenue	$1.16m	$5.20m	$9.21m
2031 EBITDA	($1.61)m	($1.30)m	$0.37m
2033 revenue	$3.33m	$17.89m	$37.09m
2033 net income proxy	**($2.83)m**	**$0.48m**	**$6.46m**
First positive EBITDA year	None through 2033	2033	2031

In the downside case, larger service tickets and low ACH use make repeat contribution negative through 2032. More such transactions deepen the loss.

An illustrative $1.5m first round funds validation

The two-year base budget tests commercial adoption and leaves a reserve for the next financing decision.

2027-2028 base cash plan	Amount
Payroll	$825,000
Customer and provider acquisition	$158,125
Fixed overhead	$160,000
Capex and risk cash	$56,416
Less gross profit generated	($146,448)
Net cash used	**$1,053,093**
Financing costs	$25,000
Remaining cash from $1.5m	**$421,907**

A first round

The base case needs further funding from 2029.

$7.30m

Cumulative base cash deficit through 2033, before a liquidity buffer.

A six-month 2033 fixed-cost buffer adds $2.74m, for $10.04m in the model. Financing amounts and valuation are illustrative, not agreed terms.

70% founder ownership before new investment

Every new equity round dilutes existing owners proportionately in this illustration.

Ownership	At formation	After round 1	After round 2
Patrick	**70.0%**	**56.0%**	**44.8%**
Other initial owners	30.0%	24.0%	19.2%
Round 1 investors	0.0%	20.0%	16.0%
Round 2 investors	0.0%	0.0%	20.0%
Total	**100.0%**	**100.0%**	**100.0%**

Each illustrative round sells 20% post-money. A later 10% option pool would reduce Patrick to 40.32%. Voting and board control require separate terms.

The investor’s return comes from equity value

Illustration: $1.5m buys 20% initially and becomes 16% after one further 20% round.

Exit equity value	Initial investor proceeds	Gross multiple
$0	$0	0.0x
$10m	$1.6m	1.1x
$50m	$8.0m	5.3x
$100m	$16.0m	10.7x

$6.0m

Illustrative pre-money value

$7.5m

Illustrative post-money value

Return arithmetic, not an exit forecast. Excludes further dilution, option pools, preferences, taxes and fees. The $0 outcome represents a complete loss.

Milestones for the next round

The strongest investment case will rest on paid cohort results from a concentrated launch.

Test	Proposed evidence
Demand and retention	500 paying households and measured second-season retention
Provider fee acceptance	Repeat visits continue with a $2.99 provider fee
Acquisition economics	Cash CAC of $50 or less in year two
Positive repeat contribution	Payment mix supports at least $0.50 per paid repeat visit
Reliability and expansion	Reliable service and economics reproduced in a second market

Material risks: off-platform migration, seasonal cash needs, high-ticket payment costs and service liability. Expansion pauses when contribution or retention misses the gate.

Model mechanics and limits

The companion workbook exposes the formulas and all editable assumptions.

Households and paid visits

Retained households plus half of new households form the season’s service base. Visits then reflect platform capture and completion.

Profit and cash

Payroll includes founder pay. Fixed costs run all year. Cash also funds equipment and a modeled risk reserve.

Revenue and cost

$45 per new pairing after waivers, plus $2.99 per paid visit. Processing uses the whole service ticket. Crew costs stay with the provider.

A cohort check

Base 2031 economics imply about $89 of five-year contribution per acquired household versus $35 CAC, or 2.6x. This is an assumption test.
