YardMatch

Investing in YardMatch

A national managed marketplace for lawn and property care

Investor discussion draft
September 2026

The investment thesis

Build local liquidity town by town, then compound the playbook across the country.

Acquire valuable relationships

A provider pays once when YardMatch delivers a new customer and the first paid job is completed.

Monetize the provider workflow

Pro and Teams help the business recruit crews, schedule work and serve the added demand.

Protect provider margins

Customers pay providers directly. YardMatch takes no percentage from repeat service revenue.

Scale by service-area cohorts

Each town or suburban cluster advances only after supply, retention and contribution gates are met.

Local property care is still fragmented

Customers need confidence; providers need demand that fits the route.

Customer friction	Provider friction	YardMatch response
Finding a reliable available business	Winning good customers efficiently	One recommendation and curated backups
Knowing whether the crew will arrive	Coordinating schedules and crews	Shared job details and arrival status
Getting the next visit handled	Turning demand into repeat routes	Rebooking, records and issue resolution

The recommendation-first experience stays central: service, timing and property come first; YardMatch recommends the fit.

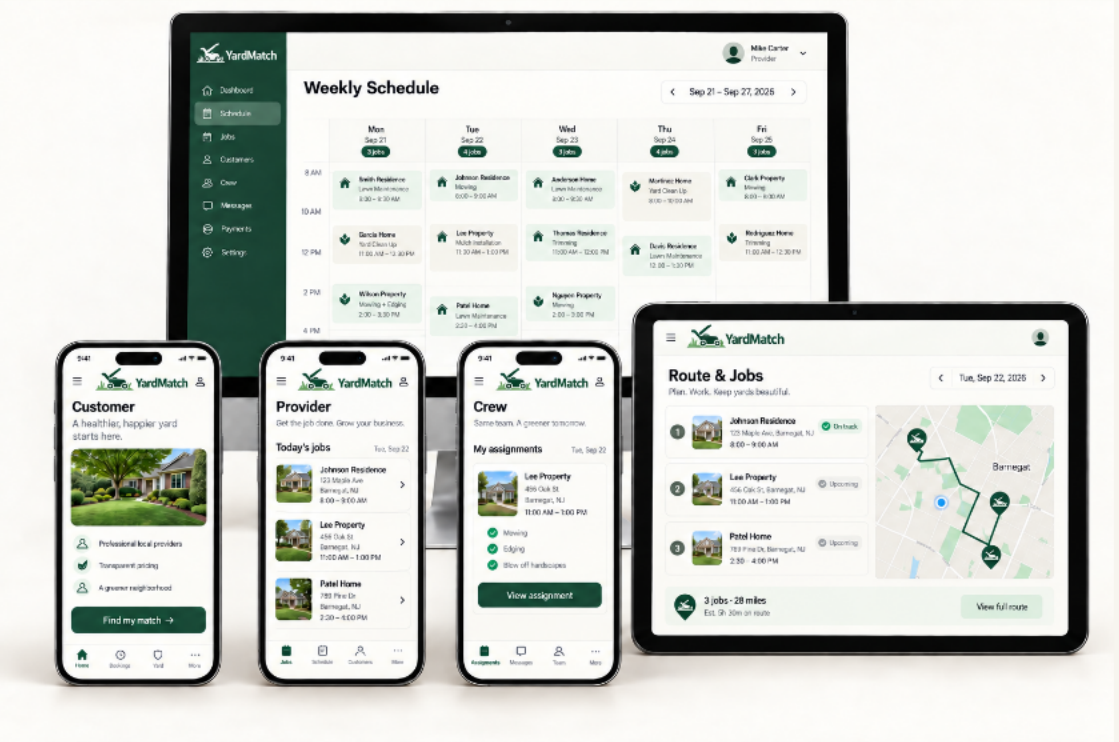

One service experience across three roles

Customer, provider and crew share the same job while each sees the information needed for the role.

Customer
Book and follow the visit

Provider
Schedule and assign work

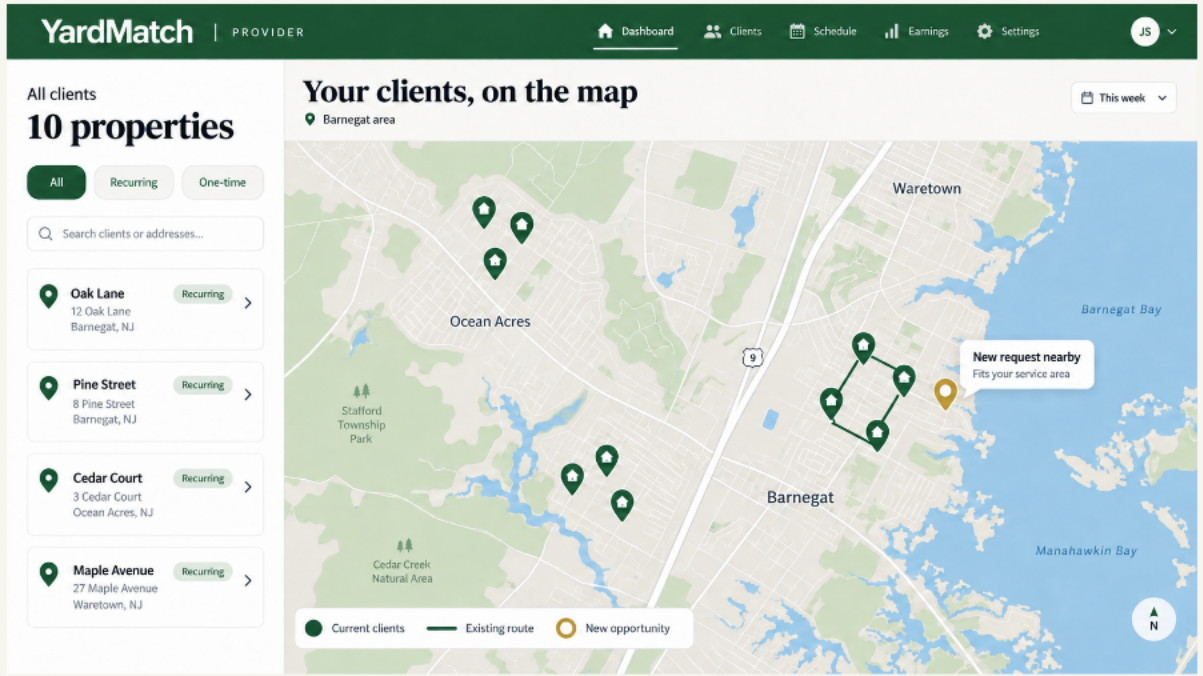

Crew
Know the place and task

Illustrative product concepts from the partner pitch. They do not show live customers, revenue or app-store availability.

Local density improves the marketplace

A concentrated launch can fit provider routes and make each acquired relationship more valuable.

For providers

Qualified demand, route fit and tools to add workers when growth creates a capacity need.

For customers

A managed recommendation, dependable service history and a consistent way to rebook.

Two revenue streams align with provider value

The model charges for customer acquisition and optional operating software.

Revenue stream	Price	When it is earned
Typical-property finder fee	$75	First completed paid job in a new relationship
Large-property finder fee	$110	First completed paid job in a new relationship
Very-large-property finder fee	$150	First completed paid job in a new relationship
Pro subscription	**$49 / month**	**Recruiting, scheduling, history, estimates and routes**
Teams subscription	**$99 / month**	**Multi-crew permissions, labor costing and utilization**

The first finder fee is waived for each new provider. Pro and Teams are optional; crew members pay nothing. Subscription status does not influence matching rank.

Zocdoc supports the acquisition-fee logic

The analogy is customer discovery, not the healthcare payment flow.

	Zocdoc	YardMatch
Charge event	Qualifying new-patient discovery booking	First completed paid job in a new pair
Repeat with same provider	No new discovery fee	No new finder fee
How service is paid	Patient / insurer pays practice	Customer pays provider directly
Additional monetization	Sponsored and practice products	Pro, Teams and later sponsored backups

A homeowner may use fewer providers than a patient uses doctors. YardMatch therefore pairs finder fees with provider software rather than relying on repeat transaction fees.

YardMatch stays outside the service-payment flow

Removing payment processing simplifies the model and preserves provider economics.

$0

YardMatch recurring service fee

$0

Customer service funds handled by YardMatch

$0

Crew-member fee

What YardMatch records	What the provider controls
Booking, service scope and scheduled time	Cash, check or the provider’s existing payment method
Completion status and service history	Customer billing, collections and tax treatment
Finder-fee eligibility and subscription status	Crew payroll, equipment and operating margin

YardMatch separately bills providers for finder fees and subscriptions. The forecast has no Stripe Connect, payout, chargeback reserve or proprietary payment-engine cost.

$60 mowing is the floor, not the average job

Service mix, neighborhood, property size and project work expand provider gross booking value.

Service	2027 starting price	Scheduled jobs / full-season household
Basic mowing	$60	12.00
Mowing + edging / trimming	$85	6.00
Expanded maintenance bundle	$120	2.00
Mulch / seasonal cleanup	$300	0.60
Tree / larger property project	$1,000	0.03

The national forecast uses the detailed New Jersey mix as a planning proxy. 2033 weighted average ticket: $139. Customer funds remain provider gross booking value, not YardMatch revenue.

Barnegat is the proving ground

The pilot converts a known local denominator into measurable launch evidence.

Barnegat launch funnel	Households
Census occupied households	10,265
Owner-occupied estimate: 88%	9,033
Assumed lawn-care eligibility: 75%	6,775
Assumed propensity to hire: 45%	3,049
2027 active YardMatch households	**240**

The 240-household launch target is a planning assumption, bounded by provider capacity. No signed provider commitments or measured outsourcing propensity are claimed.

The destination is national

The base case expands from one New Jersey service area to a broad U.S. footprint by 2033.

750
active service areas

40
states

50
metro clusters

380,000
active households

A service area can be one municipality, several neighboring small towns, or a suburban neighborhood group.

The schedule is a gated operating plan. Missing retention, supply or contribution thresholds delays the next cohort.

National expansion accelerates in cohorts

The base case reaches multiple states in 2029 and 40 states by 2033.

Year	Active service areas	States	Metro clusters	New areas launched
2027	**1**	**1**	**1**	**1**
2028	6	1	1	5
2029	25	2	3	19
2030	70	4	6	45
2031	175	10	14	105
2032	400	25	30	225
2033	**750**	**40**	**50**	**350**

Base footprint: 1, 6, 25, 70, 175, 400 and 750 service areas. Downside reaches 400 areas / 25 states; upside reaches 1,200 areas / 48 states.

A market needs several seasons to mature

The model separates launch speed from household density inside each service area.

Service-area age	Active households / area	What must be proven
Season 1	240	Supply, first-job completion and fee acceptance
Season 2	550	Second-season retention and route density
Season 3	850	Repeatable acquisition and local operations
Season 4	1,100	Provider capacity and Pro conversion
Season 5+	**1,300–1,550**	**Durable density and metro-level operating leverage**

A service area does not reach maturity in one year. New cohorts create heavy acquisition and launch spending even while older cohorts become more productive.

Every new cohort passes the same launch gates

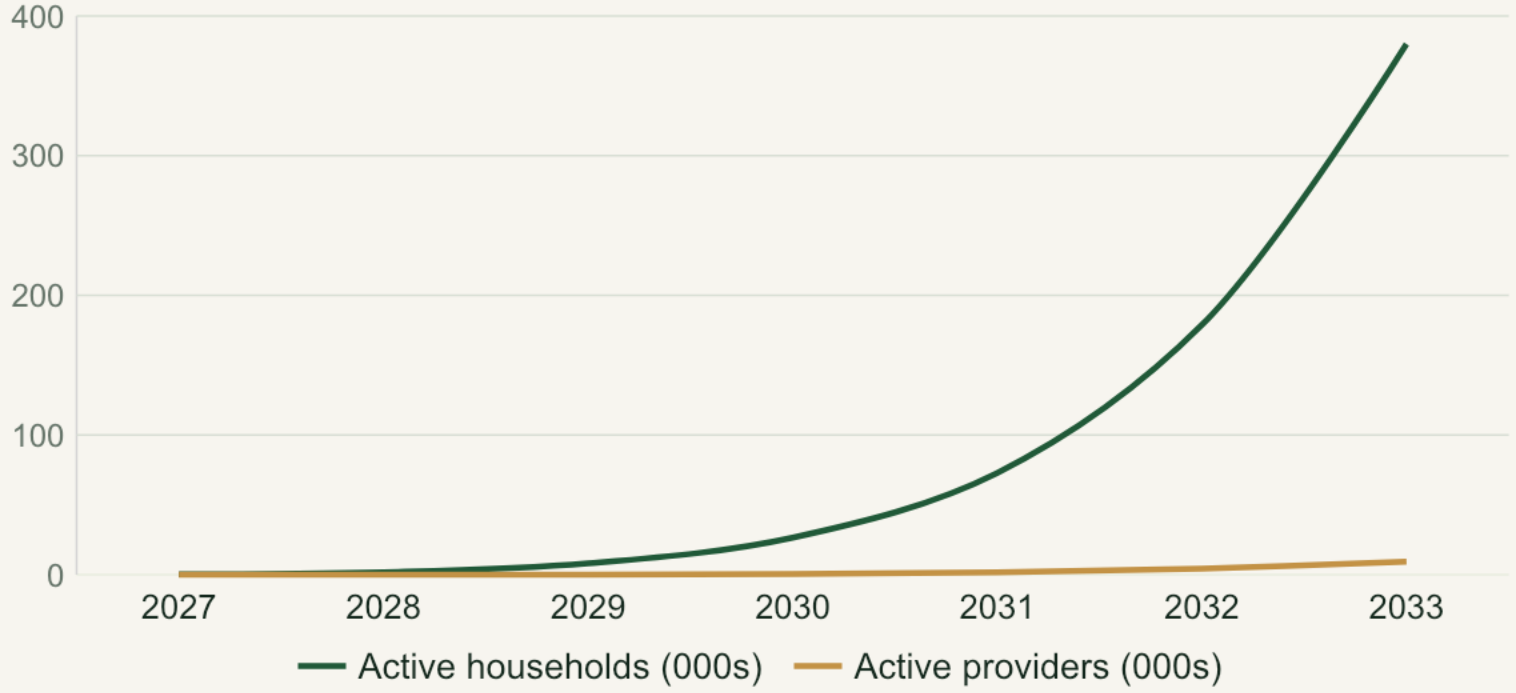

Town-by-town execution protects the recommendation quality and provider experience.

Gate	Evidence before expanding
Supply	Verified providers cover the service types, geography and seasonal capacity
Demand	Local CAC and booking conversion support the next marketing tranche
Reliability	Completion, arrival and issue-resolution standards hold under load
Retention	Homeowners return the next season and providers stay active
Economics	Finder-fee acceptance and contribution cover local growth spending

Expansion can move to adjacent municipalities faster when the same provider base and marketing channels carry across the boundary.

Cohorts create a national marketplace by 2033

Base case operational scale. Gross booking value is paid directly to providers.

380,000

2033 active households

9,500

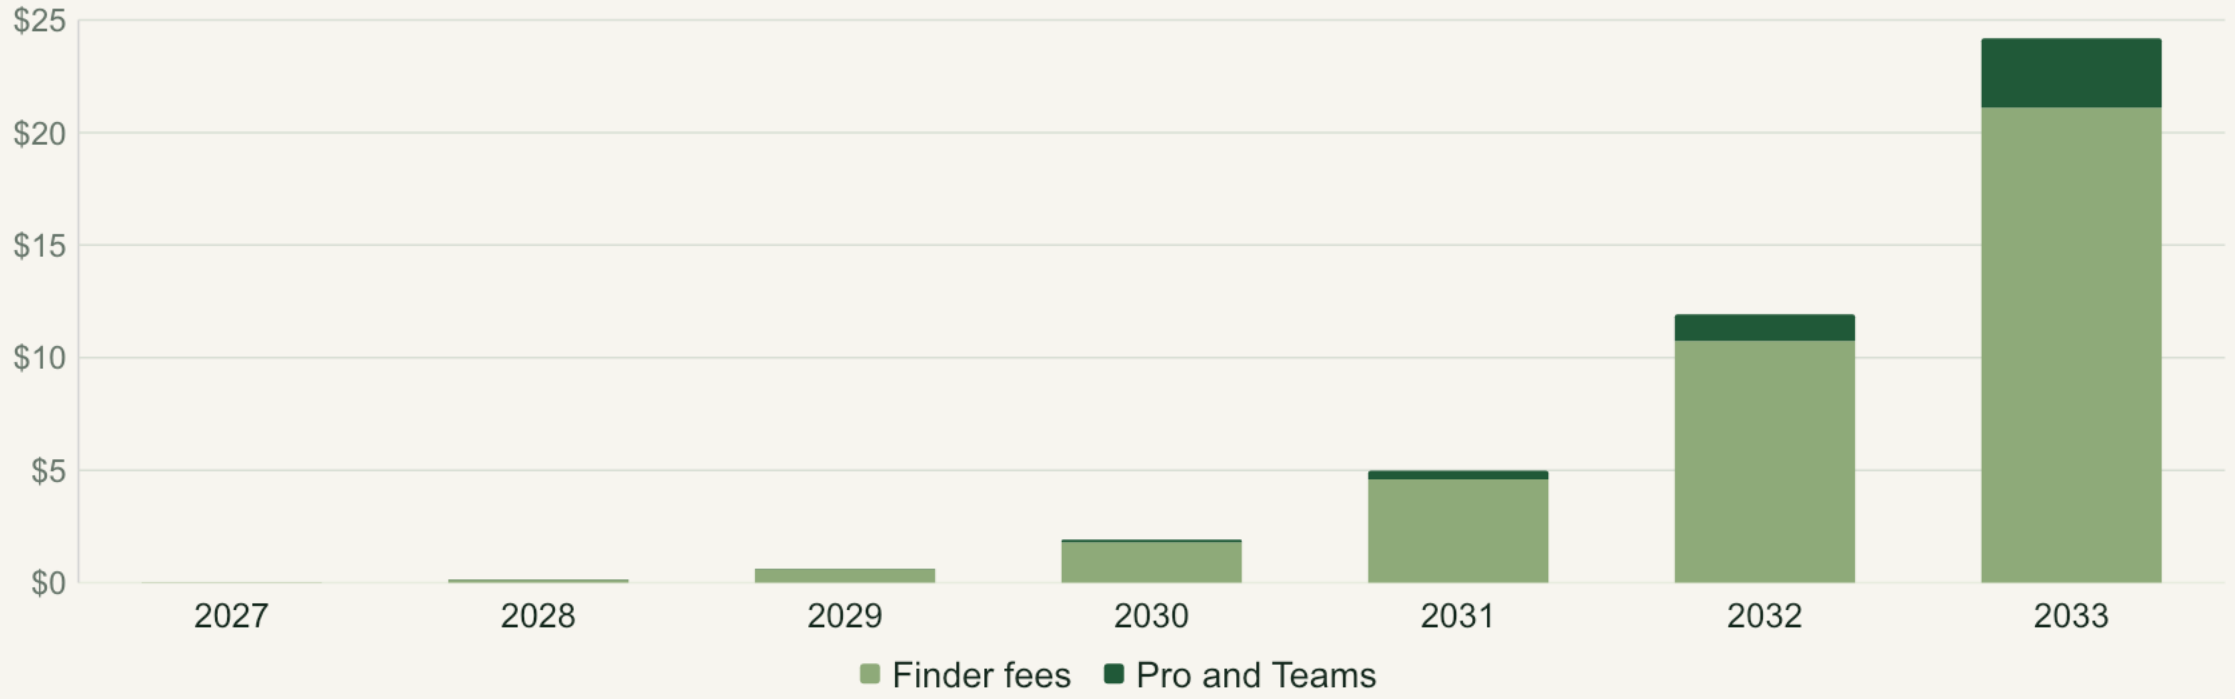

2033 active providers

$653.8m

2033 provider gross booking value

Revenue reaches $24.2m in 2033

Finder fees fund customer acquisition; provider subscriptions add recurring company revenue.

2033: $21.1m finder-fee revenue plus $3.1m net subscription revenue. YardMatch revenue equals 3.7% of provider gross booking value.

The national base case earns operating leverage

2033 EBITDA bridge. US$ millions.

2033 base bridge	Amount
Finder-fee revenue	$21.1m
Net Pro and Teams revenue	$3.1m
Cost of revenue	($1.7)m
Customer and provider acquisition	($7.5)m
Payroll	($6.6)m
Corporate + local operations	($4.8)m
Subscription operating expense	($0.1)m
EBITDA	**$3.4m**

2033 net income proxy: $2.4m. The model includes 60 paid employees and $4.3m of that year’s service-area launch, coverage and regional operating spend.

Base EBITDA turns positive in 2033

Scenario outcomes reflect different rollout speeds, CAC, staffing and overhead.

2033 result	Downside	Base	Upside
Service areas	400	750	1,200
States	25	40	48
Revenue	$13.9m	$24.2m	$38.2m
EBITDA	**($0.8)m**	**$3.4m**	**$9.3m**
Net income proxy	($1.0)m	$2.4m	$6.8m
First positive EBITDA	After 2033	2033	2032

The downside remains EBITDA-negative in 2033. The base becomes positive in 2033, while the upside reaches profitability in 2032. Rollout speed alone does not remove execution risk.

The model requires staged capital before break-even

The initial round funds proof; later rounds fund national acceleration.

$5.6m

peak cumulative funding deficit

$11.4m

capital need through 2033 incl. six-month buffer

$2.3m

2033 free cash flow before financing

Illustrative financing view	Role
$1.5m initial round	Validate Barnegat, adjacent NJ cohorts and provider pricing
Follow-on capital	Fund metro replication, staffing and household acquisition
Operating cash generation	Begins after base EBITDA turns positive in 2033

The workbook assumes only the initial $1.5m financing in the cash balance. The capital-need metric adds six months of fixed-cost buffer to the peak cumulative deficit; actual round timing requires a monthly plan.

The team scales with the footprint

A remote company still needs product, growth, marketplace and regional operating capacity.

Year	Paid employees	Active areas	Active households	Payroll
2027	**3**	**1**	**240**	**$0.3m**
2028	5	6	1,750	$0.5m
2029	8	25	8,160	$0.8m
2030	15	70	26,600	$1.6m
2031	25	175	72,900	$2.7m
2032	40	400	178,850	$4.3m
2033	**60**	**750**	**380,000**	**$6.6m**

Fully remote: no office rent, facilities or utilities. Payroll uses an average fully loaded cost rising from $100,000 in 2027 to $110,000 in 2033.

Ownership starts at 70% / 30%, then dilutes

Illustrative priced rounds show how new capital affects every existing owner.

Owner	Before financing	After 20% round 1	After 20% round 2
Patrick	**70.0%**	**56.0%**	**44.8%**
Other initial owners	30.0%	24.0%	19.2%
Round 1 investors	—	20.0%	16.0%
Round 2 investors	—	—	20.0%
Total	100.0%	100.0%	100.0%

Round 1 illustrates $1.5m for 20%, implying $6.0m pre-money and $7.5m post-money. These are discussion assumptions, not an agreed valuation or term sheet.

Capital buys a repeatable national launch system

The first dollars reduce uncertainty before the company accelerates.

Workstream	What the money proves
Marketplace liquidity	Enough verified supply and homeowner demand in each launch cohort
Product reliability	Recommendation, booking, scheduling, crew workflow and service history
Acquisition playbook	Repeatable local channels with CAC that improves as the network grows
Provider monetization	Acceptance of finder tiers and conversion to Pro / Teams
Operating controls	Support, quality, local launch and auditable marketplace operations

A payment engine is outside the plan. Capital is directed to demand, supply, product reliability and provider software.

The next round should be earned with cohort evidence

Investors should see that the Barnegat result can be reproduced in the next markets.

Evidence	Proposed proof point
Demand	240 active launch households and measurable booking conversion
Retention	Second-season homeowner and provider retention
Pricing	Finder-fee acceptance across $75 / $110 / $150 property tiers
Subscription	Providers use recruiting and workflow tools as customer demand rises
Replication	The same economics hold in adjacent service areas and a second metro

The national forecast is credible only if early cohorts prove these inputs. Expansion pauses when quality, retention, supply or contribution misses the gate.

The model makes the major risks visible

The upside is large because the plan is ambitious; the assumptions require evidence.

Risk	What the model assumes / how to manage it
Launch velocity	350 new service areas in 2033; use cohort gates and adjacent-market reuse
Provider fee acceptance	One-time finder fee follows a completed paid job; validate tier thresholds
Off-platform behavior	Software and service history must keep the relationship useful
Subscription adoption	60% Pro / Teams share by 2033; recruiting is the key wedge
Seasonality and cash	Staged rounds and a six-month fixed-cost buffer
Service quality	Curated supply, backup providers and auditable operations

Appendix: New Jersey launch evidence

Named municipal inputs 1–7 support the pilot layer; national cohorts drive the consolidated forecast.

Municipality	Households	Owner share	Median income
Barnegat	10,265	88.0%	$91,540
Stafford	12,007	90.3%	$117,612
Lacey	11,338	88.1%	$102,624
Ocean / Waretown	3,908	88.3%	$100,524
Berkeley	21,950	88.9%	$66,008
Toms River	38,047	82.1%	$99,547
Brick	30,289	82.2%	$106,130

Lawn eligibility, outsourcing, lot size, price premiums, launch timing and provider capacity are planning assumptions, not Census findings.

Appendix: New Jersey launch evidence

Named municipal inputs 8–14 support the pilot layer; national cohorts drive the consolidated forecast.

Municipality	Households	Owner share	Median income
Jackson	20,633	87.0%	$115,511
Howell	19,134	88.8%	$134,854
Wall	10,124	83.4%	$142,768
Middletown	25,211	85.7%	$141,810
Holmdel	6,429	91.6%	$165,013
Colts Neck	3,610	94.3%	$199,573
Rumson	2,451	92.9%	$250,000+

Lawn eligibility, outsourcing, lot size, price premiums, launch timing and provider capacity are planning assumptions, not Census findings.
